Link: [axesCheck PDF Test Report](#)

I passed about half of the accessibility test requirements and failed the other half of the requirements. What went well was the “Page content” section of the accessibility test. My tab order passed because it is consistent with the structure of my procedure writing and the multimedia aspects of my document are tagged too. I passed the screen flicker, scripts, and timed responses rules because these were not elements present in my procedure document.

I failed the alternate text section of the accessibility requirements because I did not use alternate text with my images. I also failed the tagged content and tagged annotation sections because I did not tag my headings or annotations in my document. Many of my failed sections related to alternate text and tagging proper headings and sections in the table of contents.

For my next steps, I will be making a lot of changes to my table of contents and images. I will update my images so that they all include alternate text and have short descriptions describing the images below too. I will also give my headings and subheadings proper tags so that it is easy for anyone to skip to the section that they need. There were some accessibility tests that I needed to manually check, such as “color contrast” and “logical reading order”, which I plan to look over again in my revised procedure document. I will make sure that the images I’m using have enough color contrast that it would pass a color contrast test on [Coolors](#) or [WebAIM](#).
